

The figure is a semi-logarithmic plot titled "Log Inc" and "Itamarati/AM". The y-axis represents the logarithm of incidence, with major ticks at 10^0 , 10^1 , and 10^2 . The x-axis represents time, with labels for 06/17/2020, 08/08/2020, 02/01/2021, 04/24/2021, and 08/17/2022. The plot contains two data series: a black line for the "Moving Average" and red stars for the "Data of citie". The moving average line starts at approximately 30 in June 2020, peaks at about 40 in July 2020, then declines to a low of about 1 in January 2021. It then rises to a peak of about 20 in March 2021, followed by a sharp decline to about 2 in April 2021, and remains relatively stable around 2 until August 2022. The "Data of citie" points show significant variability, with several points reaching up to 10^2 in early 2021 and others dropping to 10^0 in late 2021 and early 2022.
