

The graph illustrates the logarithmic trend of incidence in Maravilhas/MG. The 'Moving Average' line shows a major peak in late 2020, followed by a period of relative stability and minor fluctuations until early 2022, when it rises sharply again. The 'Data of citie' points show individual daily or near-daily incidence, with several notable outliers, particularly a high peak in late 2020 and another in early 2022.

| Date (Approx.) | Moving Average (Log Inc) | Data of citie (Log Inc) |
|----------------|--------------------------|-------------------------|
| 07/17/2020     | 1.1                      | 1.0                     |
| 08/17/2020     | 1.5                      | 1.0                     |
| 09/09/2020     | 1.2                      | 1.0                     |
| 10/09/2020     | 2.5                      | 1.0                     |
| 11/09/2020     | 25                       | 10                      |
| 12/09/2020     | 35                       | 150                     |
| 01/08/2021     | 35                       | 40                      |
| 02/08/2021     | 5                        | 2                       |
| 03/08/2021     | 2                        | 2                       |
| 04/08/2021     | 5                        | 4                       |
| 05/08/2021     | 15                       | 25                      |
