

The chart displays the daily incidence of COVID-19 in Piripá, Brazil, from May 2020 to November 2022. The y-axis represents the logarithm of the incidence rate, with major ticks at 10^0 and 10^1 . The x-axis shows dates at intervals of approximately five months. The black line represents the moving average, which smooths out the daily fluctuations. The red stars represent the daily incidence data, showing significant peaks in late 2020, early 2021, and early 2022. The incidence rate generally remains below 10^1 throughout the period, with a notable peak in early 2022 reaching nearly 10^2 .
