

The graph illustrates the logarithmic incidence of COVID-19 in Rubiácea/SP. The y-axis, labeled 'Log Inc', uses a logarithmic scale from 10^0 to 10^2 . The x-axis represents time from June 24, 2020, to August 26, 2022. Red stars represent daily incidence data, while the black line represents the moving average. A major peak is observed in late 2021, with daily incidence reaching approximately 100 on the log scale. The data shows high volatility with frequent spikes and troughs, particularly in the early and late stages of the period shown.
