

The figure is a semi-logarithmic plot titled 'Catuti/MG'. The vertical axis is labeled 'Log Inc' and has major ticks at  $10^0$  and  $10^1$ . The horizontal axis shows dates from 08/26/2020 to 08/05/2022. A legend in the top-left corner identifies the black line as 'Moving Average' and the red stars as 'Data of citie'. The data shows two distinct waves of infection. The first wave begins in late 2020, peaks in early 2021 at a log incidence of approximately 9, and then declines. The second wave is more intense, starting in late 2021, peaking in early 2022 at a log incidence of approximately 12, and then declining again. The scatter plot data points generally follow the trend of the moving average line.
