

The graph displays the logarithmic incidence rate over time. The 'Moving Average' line shows a significant peak in late 2020, reaching a value of approximately 10. This is followed by a period of relative stability around 2-3, and then a sharp decline to near 1 in early 2021. The 'Data of citie' points show individual daily or weekly measurements, with several high values in late 2020 and early 2021, and many points at the baseline of 1.0.
