

The graph illustrates the logarithmic incidence of COVID-19 in Berilo, Minas Gerais, from August 2020 to July 2022. The black line represents the moving average, which shows a general upward trend with significant fluctuations, including a major peak in late 2020 and another in early 2021. The red stars represent individual daily incidence data points, which show high variability, with several points reaching the maximum value of 100 on the logarithmic scale. The data points often deviate from the moving average, indicating periods of high and low incidence.
